

Drone Status Indicator

Today, I developed a simple Drone Status Indicator using ESP32 and MicroPython in Wokwi. The project uses a green LED and a red LED to indicate the drone's status based on user commands. When the user enters "takeoff", the green LED turns on, indicating that the drone is ready for flight. When the user enters "land", the red LED turns on, indicating that the drone has landed.

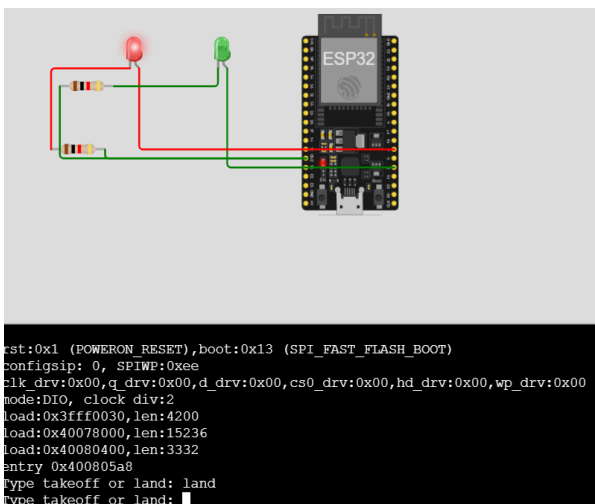

Through this project, I learned how to use GPIO pins, control multiple LEDs, accept user input, and implement basic drone-related logic using ESP32.
