

ESP32

Introduction to ESP32

ESP32 is a low-cost microcontroller developed by Espressif Systems. It has built-in Wi-Fi and Bluetooth capabilities, making it suitable for IoT and embedded system applications. It can read sensor data, control devices, and communicate with cloud platforms.

Topics Learned

- Basics of ESP32 and its features
- GPIO (General Purpose Input/Output) pins
- Introduction to MicroPython programming
- LED interfacing with ESP32
- Wokwi simulation platform
- Digital output control using GPIO pins

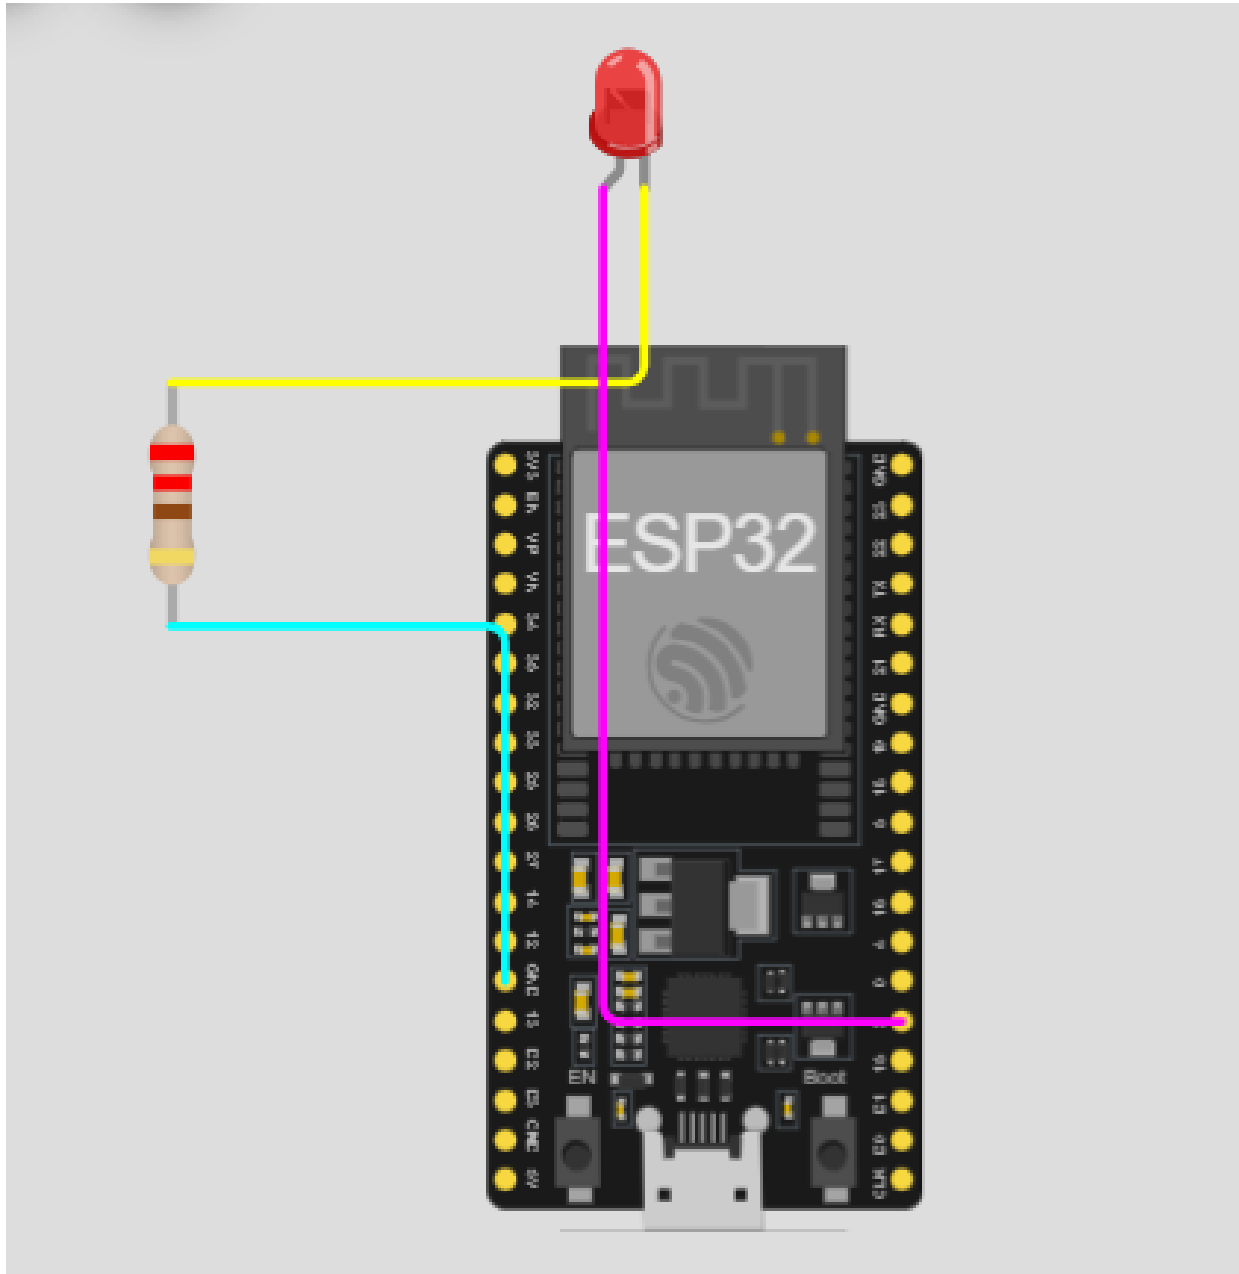

Practical Activity

Created an ESP32 LED Blink project using MicroPython in Wokwi. The LED was connected to a GPIO pin and programmed to turn ON and OFF repeatedly at one-second intervals.

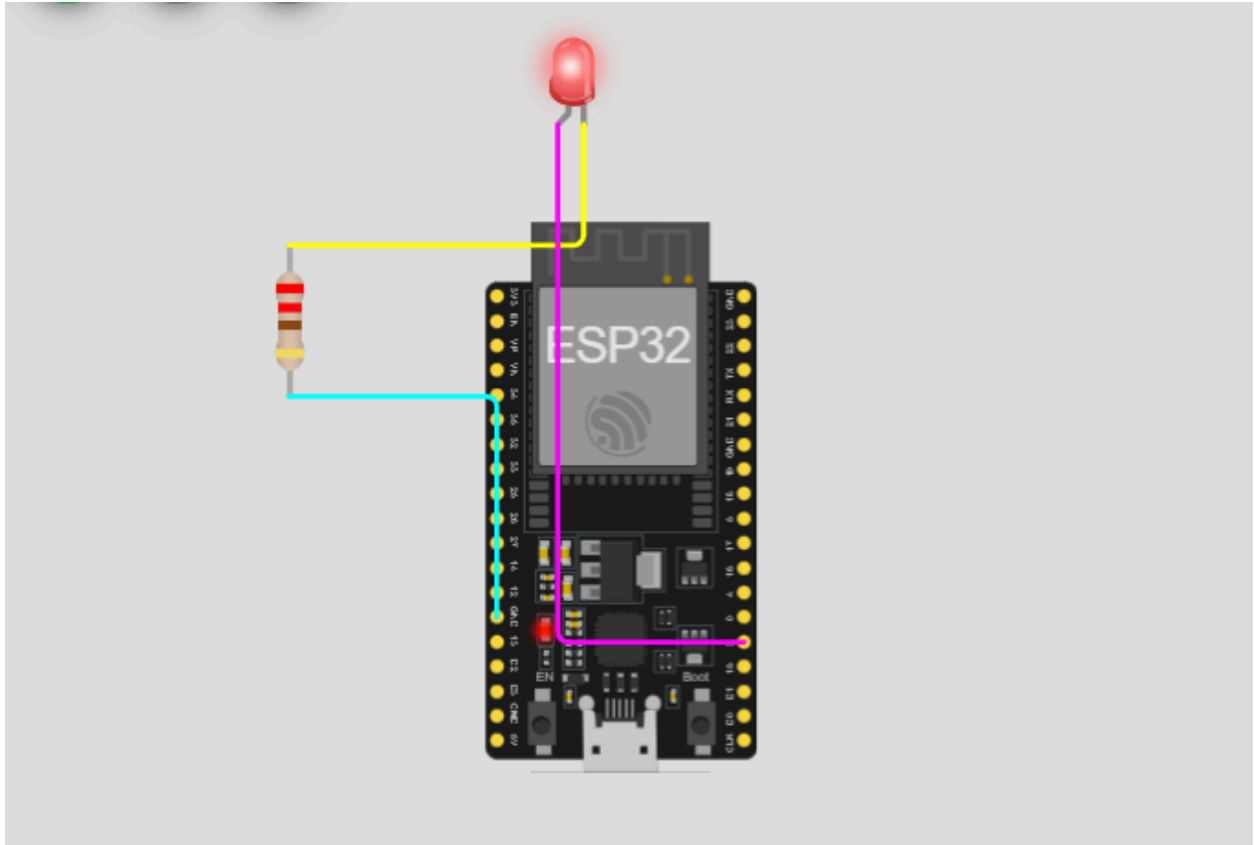

Learning Outcome

Gained an understanding of ESP32 programming, GPIO pin control, basic circuit connections, and MicroPython-based embedded system development.
